Frequently developers spend time away from coding to run builds and test their code, resulting in delays and mounting opportunity costs. This has a knockon effect as it trickles throughout a project, where developers are waiting for their teammates to complete work on which they depend.

Bamboo has been a popular solution in the automation of testing and deployment, with alerts provided along the way, reducing operational friction and easing the project pains. With seamless integration into the suite of Atlassian tools, developers still need a better way to collaborate around their code and pipeline that fits within their workflow, so that they can optimize their contextual intelligence and shorten the development lifecycle.

Symphony for Bamboo provides secure real-time interactive collaboration around your CI pipeline. Whether it is running a build or testing your code, team members can stay connected and aligned with their projects, helping them to meet their milestones and objectives.

Benefits

- Reduce the friction of testing and deploying code
- Improve team productivity and speed by empowering people to collaborate and stay informed at all times, without having to shift to an out-of-band communication tool like email
- Increase the speed of innovation by removing operational barriers
- Optimize your developer tools return on investment with additional Symphony integrations for Atlassian products such as Jira, Confluence and Bitbucket

Success! #PRJ -> PASS -> 2 by Admin

Contextual Intelligence

Select where job, project and agent alerts go to keep mission critical information from Bamboo and your colleagues on your projects:

- In the right context, at the right time
- Help keep projects on track
- Successfully make your deadlines.

Actionable Linking

Deep linking from Symphony alerts to Bamboo allows you to take action and dig into project details, saving valuable time that you can use for enhancing, reviewing and pushing code from your continuous integration pipeline.
