

# Symphony Integrations

## Bitbucket

Collaboration increases pipeline velocity.

Agile organizations use Bitbucket to store Git code, with the additional benefit of building, testing and deploying with CI/CD. With seamless integrations with other Atlassian tools, Bitbucket is an important tool in digital operations and the software development lifecycle. However, companies also experience demand for a better way to collaborate, in real-time, across all their tools in order to reduce the distance between their team, tools and systems, resulting in shorter build times.

Bitbucket for Symphony provides secure and real-time interactive collaboration around code management. From the time a repository is created, through pushes and pull requests, team members can stay connected and more closely aligned. With the integration, team members can provide commentary to other team members throughout the process, allowing a reduction in project time and help meet deadlines.

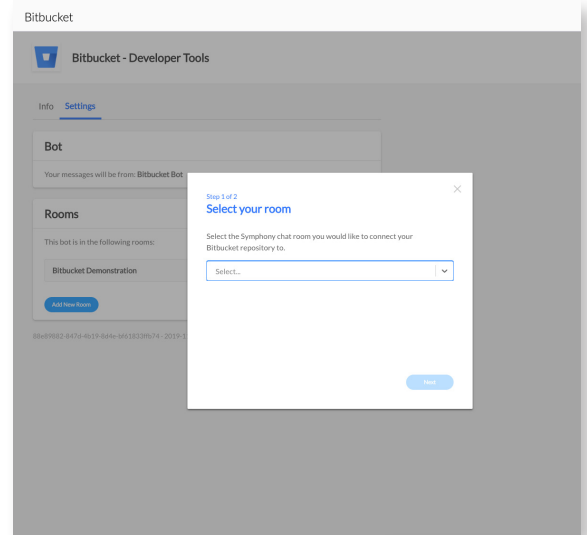

### Benefits

- Reduce tool fatigue by consolidating tools into a single point of collaboration
- Improve team productivity and speed by empowering people to collaborate and stay informed at all times, without having to shift to an out-of-band communication tool like email
- Optimize the realized return on the firm's technical investments

## Customize Notifications and Alerts

You choose the Bitbucket events that trigger Symphony notifications. Receive alerts via secure chat rooms. No matter where your team members are—at their desk, on the company campus, on the road using the Symphony mobile app— they get the real-time information they need.

## Contextual Intelligence

Keep mission critical information from Bitbucket and your colleagues on your projects in the right context and at the right time, helping to keep the projects on track so that you can successfully make your deadlines.
