

Introducing Symphony 2.0

Secure Collaboration Re-Wired for Speed and Flexibility

Industry Under Pressure

With shrinking margins, complex regulatory requirements, and outdated manual processes, leading financial firms are investing in digitalization. Looking to automate workflows wherever possible, they want to leave phone calls, email, and faxes behind in favor of more efficient collaboration.

Symphony is already helping the world's leading banks collaborate and automate. As the industry's only secure and compliant platform, Symphony's global directory of verified users connects a large and growing community of trusted counterparties.

Now, Symphony is introducing a new user experience that is built from the ground up on the same secure and compliant platform. It is clean and simple, providing efficient interactions and flexible workspace management.

Performance When Seconds Count

Every interaction has been tested for usability and performance. From front office to back office, inside the firm to counterparty collaboration, workflows are now faster and more fun.

Do It Your Way

Symphony knows that not everybody works the same way. Symphony 2.0 introduces workspace customization tools that let users create customized views around their particular priorities. With new notification settings, users can easily control and prioritize alerts, eliminating noise and ensuring that they never miss an important message.

Innovate, Integrate, Extend

Symphony has always been about extensibility. The platform supports a large and growing portfolio of bots and application integrations. Global leaders in finance are using our backend APIs to modernize and automate workflows. Now Symphony is introducing a comprehensive set of User Interface extension capabilities and pre-built interface “Elements” for bots and application integrations.

Developers can now use our standard UX component libraries and UI extension framework to create sophisticated workflows in record time. Symphony’s customers are already integrating with incident management, pricing systems, source management, and other mission-critical systems. All of these integrations are uniquely protected with Symphony’s end-to-end encryption.

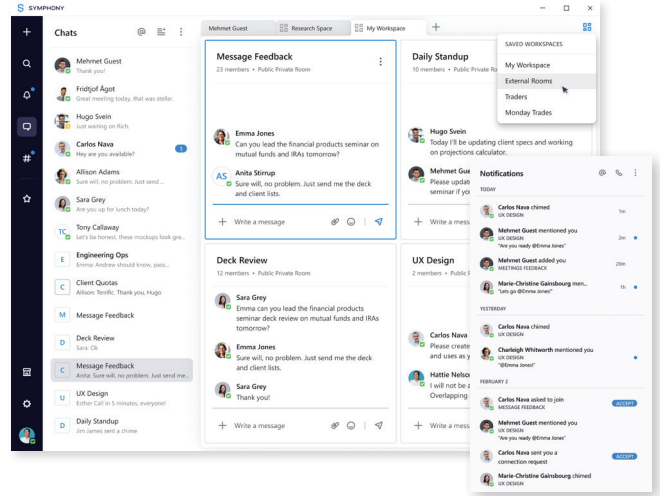

Work Together, Securely

The world’s leading financial institutions already trust Symphony to help them automate and accelerate work. Now, Symphony 2.0 takes the next step in re-wiring secure collaboration. With a cleaner, simpler, more flexible experience, employees can do more, faster—with end-to-end security and compliance they can trust.
